## 26 Tables, Formulas, and Measurements

## INTEREST COMPUTATION AND TABLES

Simple interest computation involves multiplying the principal (amount of note) by the selected interest rate and the product or result is the interest for one year. Remember, the interest rate ( .06 or .09 for example) is a decimal and two points are to be marked off from the right.
There are 12 months in a year or 365 days. This latter figure makes for an awkward denominator. As a result, as an acceptable business practice, we assume 12 months of 30 days each, and 360 days to a year.
To avoid long computations which may involve cumbersome fractions, it is common to use prepared computations in the form of interest tables which show the base as $\$ 1, \$ 100$ or $\$ 1,000$ for a variety of interest and time periods. From the interest table, we determine the factor and multiply it by the amount involved if it exceeds or is less than the base of the table. The following illustrates the different methods and short cuts.

## Long Conventional Method

1. What is the interest on $\$ 4,650$ for 75 days at 10 percent?
2. What is the interest on $\$ 4,650$ for 1 year, 4 months and 10 days at 10 percent?

Answer:

1. $4650 \times .10 \times 75 / 360=\$ 96.88$
2. $4650 \times .10 \times\{360+120+10\}$ or $490 / 360=\$ 632.92$
(proper fraction for periods if less than 1 year; improper fraction for periods of more than 1 year)

## Use of Interest Tables Method

1. Same problem

Look in table on next page for 30 days at 10 percent

| factor is | 8.3340 | $=30$ |
| :--- | ---: | :--- |
| factor is | 8.3340 | $=30$ |
| factor for 15 days | $\underline{4.1670}$ | $=\underline{15}$ |
| $\mathbf{2 0 . 8 3 5 0}$ |  | 75 |

\$4,650 = \$4.65 per \$1,000
Multiply $\$ 4.65$ x $20.8350=\$ 96.88$
2. Table not complete to show higher factors, but it could be done this way:

30 day factor

| 8.3340 <br> x 16 <br> 133.3440 | (16 months) |
| ---: | :--- |
| $\frac{2.7780}{136.1220}$ | (10 days) <br>  |
|  | 4 months and 10 days at $\$ 1,000$ |

Therefore, $136.1220 \times 4.65$ (number of thousands) $=\$ 632.92$ interest.

## OTHER SHORTCUT METHODS

## FOR COMPUTING SIMPLE INTEREST

4\% Multiply the principal by number of days; cut off right-hand figure and divide by 9 .
$5 \% \quad$ Multiply by number of days and divide by 72.
6\% Multiply by number of days; cut off right-hand figure and divide by 6 .
$7 \% \quad$ Compile the interest for $6 \%$ and add $1 / 6$.
$8 \% \quad$ Multiply by number of days and divide by 45.
$9 \% \quad$ Multiply by number of days; cut off right-hand figure and divide by 4.
10\% Multiply by number of days and divide by 36 .

## BANKERS 12\%-30 DAY/6\%-60 DAY INTEREST COMPUTATION METHOD

## (Using $\mathbf{3 6 0}$ day year)

To find interest on any principal amount for 30 days at $12 \%$, or for 60 days at $6 \%$, simply move the decimal point in the principal amount two places to the left.
Therefore, the interest amount on $\$ 8432.67$ at $12 \%$ for 30 days is $\$ 84.33$.
Likewise, the interest amount on $\$ 8432.67$ at $6 \%$ for 60 days is $\$ 84.33$
(Since $12 \%$ per annum is $1 \%$ a month, and $1 \%$ of any number is the hundredth part of it, then by pointing off two places from the right of a number, it is in effect divided by 100.)
What is the interest on $\$ 7397.64$ at $9 \%$ for 69 days?
Interest @ 6\% for 60 days = $\$ 73.98$ (move decimal two places to left)
Interest @ $\underline{3 \%}$ for 60 days $=\underline{36.99}(1 / 2$ of $6 \%$ amount $)$
Interest @ 9\% for 60 days = 110.97
We still need 9 days more interest:
6 days $=1 / 10$ of 60 days: 6 days $=11.09(1 / 10$ of $\$ 110.97)$
3 days $=1 / 2$ of 6 days $\quad \underline{3 \text { days }}=\underline{5.55}(1 / 2$ of $\$ 11.09)$
9 days $=16.64$
Therefore, interest @ 9\% for 69 days $=\$ 110.97$ + \$16.64 = \$127.61

## FORMULAS

## Three-Variable Formulas

In three-variable formulas, each variable is a function of the other two.

$$
\begin{gathered}
\text { Income Formula } \\
\text { Income }=\text { Rate } \times \text { Value } \\
I=R \times V \\
R=I \div V \\
V=I \div R
\end{gathered}
$$

## Percentage Formula

Percentage $=$ Rate $\times$ Base

$$
\mathrm{P}=\mathrm{R} \times \mathrm{B}
$$

$R=P \div B$
$B=P \div R$

## Area Formula

$$
\begin{gathered}
\text { Area }=\text { Length x Width } \\
\text { A }=\mathrm{L} \times \mathrm{W} \\
\mathrm{~L}=\mathrm{A} \div \mathrm{W} \\
\mathrm{~W}=\mathrm{A} \div \mathrm{L}
\end{gathered}
$$

## Property Tax Formula

Tax $=$ Assessed Value $x$ Rate

$$
\begin{aligned}
& \mathrm{T}=\mathrm{A} \times \mathrm{R} \\
& \mathrm{~A}=\mathrm{T} \div \mathrm{R} \\
& \mathrm{R}=\mathrm{T} \div \mathrm{A}
\end{aligned}
$$

## Commission Formula

Commission $=$ Sale Price $\times$ Rate
$C=S \times R$
$\mathrm{S}=\mathrm{C} \div \mathrm{R}$
$\mathrm{R}=\mathrm{C} \div \mathrm{S}$

## LINEAR AND SPATIAL MEASUREMENTS

## AS USED IN APPRAISING AND LAND DESCRIPTIONS

## Common Linear Measurements

One foot = 12 inches
One yard = 3 feet or 36 inches
One rod = $161 / 2$ feet or $51 / 2$ yards
One furlong = 40 rods
100 feet $=6.6$ rods
One mile $=5,280$ feet; 1,760 yards; 320 rods; or 80 chains

## Surveyors' Measurements

1 link = 7.92 inches
1 rod $=25$ links
1 chain $=4$ rods or 66 feet
(These are the old surveyors' measurements. Modern surveyors use a steel tape or what is called an
engineer's chain which is 100 feet long with links of one foot. Thus, a mile measured by a modern steel tape chain is 52.8 chains.)

## Spatial or Area Measurements (Length x Width)

1 square foot = 144 square inches
1 square yard $=9$ square feet
1 square rod = $301 / 4$ square yards
1 acre $=10$ square chains; 160 square rods; 4,840 square yards; 43,560 square feet
(An acre is an odd and inconsistent measurement. It is supposed to have been the amount of land that a farmer could plow in a day with oxen and the old wooden plow. As a square, it is approximately 208.71 feet on a side.)
A section $=1$ square mile or 640 acres
A township $=36$ square miles
A quarter section $=160$ acres
Area of a square or rectangle = length x width in unit of linear measurement used

Area of a triangle $=$ base $\times 1 / 2$ height
Cubic Measurement (Length $x$ Width $x$ Height)
1 cubic foot $=1,728$ cubic inches.
1 cubic yard $=27$ cubic feet.

## SOME METRIC EQUIVALENTS

| Lengths | Areas |
| :--- | :--- |
| one foot $=0.3048$ meter | one square foot $=0.0929$ sq. meter |
| one yard $=0.9144$ meter | one square yard $=0.836$ sq. meter |
| one mile $=1.6093$ kilometers or 1609 meters | one acre $=4068.8$ sq. meters |
| one meter $=39$ inches | one square mile $=259$ hectares or 2.59 sq. km. |
| one kilometer $=3281$ feet or .62 miles or 1000 <br> meters | one square meter $=10.76$ sq. feet |
|  | one hectare $=2.47$ acres or 10,000 sq. meters |
